

IT Solutions Designed for Your Practice

People today pay a premium for health care and coverage, and expect their visit to the clinic to be worth the cost. To provide their patients the best care possible, many healthcare organizations have begun to lean on information technology. At Acclamar, we are proud to present comprehensive delivery, support, and maintenance of IT systems to medical practices.

The healthcare industry has many required compliance standards that health care organizations like yours need to adhere to in order to legally and securely share patient and financial information. Under the Health Insurance Portability and Accountability Act (HIPAA), healthcare providers are required to securely transmit and store this information using an assessor-approved IT infrastructure. These protocols are put in place by the U.S. Department of Health and Human Services and compliance is required of all organizations that will have access to a patient's personal records.

In order to get your IT infrastructure HIPAA-compliant, you will need to set up a system that provides your organization the ability to properly and securely proliferate your patients' information to work for their benefit. After all, by digitizing the process, and utilizing solutions such as the electronic medical record (EMR), more patients can be seen and more information can be shared; resulting in superior care.
